Hence it appears that the general equation of the second degree wanting the term $2Bxy$ represents an ellipse, a parabola, a hyperbola, two right lines, one right line, or an isolated point; except in certain cases where it does not represent any locus. The following proposition will complete the discussion of the general equation. Prop. XLI. 187. To shew that the term $2Bxy$ may be made to disappear from the general equation of the second degree by turning the axes of co-ordinates through a certain angle. If, in the general equation $Ax^2 + 2Bxy + 4Cy + 2Dx + 2Ey + F = 0$ (1), we write $x \cos \theta - y \sin \theta$ in place of x , and $x \sin \theta + y \cos \theta$ in place of y , we turn the axes through the angle θ , leaving the origin unaltered (see Art. 104). When these substitutions for x and y are made, (1) may evidently be expanded and arranged so as to assume the form $Ax^2 + 2B'xy + Cy^2 + 2Dx + 2Ey + F = 0$ (2), A, B, C, D, E, F being quantities formed from A, B, C, D, E , and θ , in arranging the equation in the form (2). $2B'xy$ is the only term of (2) we have occasion to know for our present purpose; it can only arise from the three first terms of (1), which,...
